Linear Functions

For each of the following equations, the value y is a linear function of the number x . For each of these functions, analytically find (i) the x -intercept and the y -intercept; (ii) the slope m ; (iii) the root input; (iv) the set of upper inputs; and (v) the set of lower inputs. Then sketch a good graph of each function.

1. $2x - y = 4$ 2. $y = 3 - x$ 3. $y = -1.5$ 4. $2(x - y) = 3(1 - y)$

For each of the lines in Practice Exercises 5–8, (i) compute or estimate the slope; (ii) give the symbol rule.

9. What is the slope of a vertical line? Justify your answer.

10. Consider the linear function $4x + 3y = 24$. Find the length of the portion of this line that is contained in the first quadrant. (Hint: Graphing the line might help.)

11. Let $f(x) = 3x - 1$. Simplify each of the following expressions.

a. $\frac{f(5) - f(2)}{5 - 2}$

b. $\frac{f(1) - f(-3)}{1 - (-3)}$

c. $\frac{f(2/3) - f(1/3)}{(2/3) - (1/3)}$

d. $\frac{f(x+h) - f(x)}{(x+h) - x}$

12. The owner of the Egg Roll Cart has determined that the monthly profit y (in dollars) and the number x of egg rolls that are sold are related by the equation $0.1x - y = 300$.

a. Show that y is a linear function of x by rewriting the equation in explicit form and then identifying the coefficients m and b .

b. Interpret the slope m of this function using a complete sentence.

c. Is the value 100 in the range of this function? If the answer is yes, find the matching input.

d. Determine if the point $(3\,000, 0)$ lies on the graph of this function. Justify your answer.

e. What is the y -intercept of this function? How would you interpret this value in the context of the problem?

13. General Chip Corporation has signed a contract with Tuan and Ermelinda to purchase their jalepeño flavoring for potato chips. A mechanical engineer at General Chip is designing a new machine to coat the chips with the jalepeño flavoring. This machine will have a dial that can be set from 0 to 20. At a setting of 0 the machine can coat 80 oz per minute, while at a setting of 20 the machine can coat 240 oz per minute. In order to scale the dial properly, the engineer must determine a linear function relating the amount A of chips coated per minute to the machine dial setting x .

- a. Evaluate $A(0)$.
- b. Evaluate $A(20)$.
- c. Find the application domain of A .
- d. Sketch a good graph of the function A .
- e. Find the slope m of the function A .
- f. Interpret the slope m of the function A using a complete sentence.
- g. Derive the symbol rule for the function A .
- h. Find the input to the function A that matches the output 190. Find this input using *both* graphical and analytical methods. How closely do the two inputs agree? Which method do you prefer?
- i. Find the dial setting that coats 135 oz of chips per minute.

14. Match each of the following linear functions with its graph. All graphs have the same graphing window.

- a. $y = 2x - 7$
- b. $y = -3x + 3$
- c. $y = x/2 + 5$
- d. $y = 5x - 7$
- e. $y = -x + 3$
- f. $y = 4x + 5$

i.
